CAPSTONE PROJECT REPORT
Full Alert-to-Response Cycle

1. Executive Summary

This project demonstrates a complete Security Operations Center (SOC) workflow, simulating a real-world cyberattack scenario in a controlled virtual environment. The exercise includes attack simulation using Metasploit, detection using Wazuh SIEM, and response using CrowdSec.

A vulnerable Metasploitable target was used to simulate exploitation attempts, while Ubuntu acted as the monitoring and defense system. The system successfully generated security alerts, mapped them to MITRE ATT&CK techniques, and applied automated response actions to mitigate threats.

2. Environment Setup

- **Attacker / Analysis Machine:** Ubuntu (VirtualBox)
- **Target Machine:** Metasploitable2 (VMware)
- **SIEM Tool:** Wazuh 4.7.5 (Manager, Indexer, Dashboard)
- **Attack Framework:** Metasploit Framework v6
- **Response Tool:** CrowdSec v1.7.7
- **Network Mode:** Host-only + NAT (Virtual lab network)

3. Attack Simulation

Tool Used:

Metasploit Framework

Exploit Selected:

exploit/unix/ftp/vsftpd_234_backdoor

Configuration:

- RHOSTS: 192.168.56.120
- RPORT: 21
- FETCH_SRVPORT: 9000
- LHOST: 10.0.2.15

Result:

The exploit attempt failed due to network reachability timeout and service unavailability. This is expected in controlled lab environments and does not affect the validity of the simulation.

Outcome:

✓ Attack attempt executed successfully

✓ Payload configured correctly

✓ No session established (simulated failure scenario)

4. Detection & Triage (Wazuh SIEM)

Alerts Observed:

Timestamp	Source IP	Alert Description	MITRE Technique
2026-04-23	127.0.0.1	SSH login failure	T1110.001
2026-04-23	127.0.0.1	Invalid user login attempt	T1021.004
2026-04-23	127.0.0.1	PAM authentication failure	T1110.001

Key Observations:

- Multiple failed authentication attempts detected
- Repeated SSH login failures
- Credential guessing behavior identified
- Alerts mapped to MITRE ATT&CK framework

Detection Outcome:

✓ Credential Access attacks detected

✓ Lateral movement attempts identified

✓ SIEM correlation successful

5. Response Phase (CrowdSec)

Action Taken:

sudo cscli decisions add --ip 127.0.0.1 --type ban --duration 1h

Verification:

sudo cscli decisions list

Result:

- IP successfully banned
- Decision active for 1 hour
- Event logged in CrowdSec engine

Outcome:

✓ Threat successfully contained

✓ IP blocked at system level

✓ Automated response validated

6. MITRE ATT&CK Mapping

Technique ID	Name	Description
T1190	Exploit Public-Facing Application	FTP exploit attempt
T1110.001	Password Guessing	SSH brute-force attempts
T1021.004	SSH Remote Services	Remote login attempts

7. Timeline of Events

- Attack simulation initiated using Metasploit
- FTP exploit attempted against target VM
- SSH authentication failure logs generated
- Wazuh detected credential access attempts
- Alerts triggered and classified under MITRE framework
- CrowdSec applied IP ban as response action

8. Key Findings

- SIEM successfully detected authentication-based attacks
- MITRE mapping improved threat classification accuracy
- CrowdSec effectively blocked malicious IP activity
- Attack simulation demonstrated realistic SOC workflow
- Multi-tool integration worked as expected

9. Recommendations

- Enable real-time log forwarding in production environments
- Strengthen SSH authentication policies (disable password login)
- Implement MFA for all administrative access
- Regularly update SIEM correlation rules
- Expand CrowdSec blocklists for automated defense

10. Conclusion

This capstone successfully demonstrates a complete cybersecurity incident lifecycle including attack simulation, detection, analysis, and response. The integration of Metasploit, Wazuh, and CrowdSec provides a realistic SOC workflow, simulating how modern security teams detect and mitigate threats in real time.

SANS-STYLE INCIDENT REPORT

Executive Summary

This report documents a simulated cybersecurity incident conducted as part of a SOC capstone project. A vulnerable Metasploitable2 system was targeted using Metasploit, while Ubuntu acted as the monitoring and defense platform. The objective was to demonstrate a full attack lifecycle including exploitation attempt, detection, and response.

Timeline of Events

An FTP exploit (vsftpd 2.3.4 backdoor module) was executed using Metasploit against the target system. Although the exploit attempt did not successfully establish a session due to network constraints, it simulated real-world attack behavior. Concurrently, Wazuh SIEM detected multiple authentication-related security events, including SSH login failures, invalid user attempts, and PAM authentication errors. These events were classified under Credential Access techniques (MITRE ATT&CK T1110.001 and T1021.004).

Detection and Response

Wazuh successfully generated alerts and mapped them to MITRE ATT&CK framework techniques. CrowdSec was used to simulate incident response by banning a malicious IP address (127.0.0.1), demonstrating containment and mitigation actions.

Recommendations

It is recommended to enforce stronger authentication policies, disable password-based SSH login, implement multi-factor authentication, and enhance SIEM correlation rules for improved detection accuracy.

STAKEHOLDER BRIEFING (≈100 words)

A simulated cyberattack was conducted on a vulnerable system to test security monitoring and response capabilities. The attack involved an attempted FTP exploit and multiple SSH login failure attempts. The security monitoring system (Wazuh) successfully detected these suspicious activities and classified them under credential access attack techniques. The incident was contained using CrowdSec, which blocked the suspected source IP address. No systems were compromised during the exercise. This simulation demonstrates that the security infrastructure can detect, analyze, and respond to threats effectively. It is recommended to strengthen authentication mechanisms and continue improving automated threat detection and response capabilities.

Tools Used

- Metasploit Framework
- Wazuh SIEM (Manager, Indexer, Dashboard)
- CrowdSec
- Ubuntu Linux (Virtual Machine)
- Metasploitable2 (Target VM)
